

## **Quietest Professional Vacuum Cleaner – SSHH!!**

The TASKI AERO tub vacuum cleaner from Diversey is believed to be the quietest and most energy-efficient machine currently available on the professional cleaning market. The four models in the range produce only 53dB(A) of sound and utilise just 585W of electrical power in standard mode yet produce as much cleaning suction as machines rated at 1000W or more. In “eco” mode they produce just 50dB(A) and consume a mere 295W. On energy savings alone, they can pay for themselves in under three years.

Available in eight and fifteen litre tank capacity models, both with mid-class and performance versions, the range meets demand for vacuums that comply with the stringent sound and energy limits specified in EU Regulations EU665/2013 and EU666/2013, in force since September 2017.

The TASKI AERO vacuum’s revolutionary design ensures the maximum amount of air is used to create the all-important suction at the cleaning head. By redesigning the machine’s internal airways, TASKI engineers eliminated the obstructions, constrictions and potential points of leakage that reduce efficiency and produce unnecessary noise. Adding newly-designed components and ultra-efficient electric motor further boosted efficiency and cut noise. This combination of patented designs and components is called “whisper technology”.

Trials show TASKI AERO vacuums in typical professional settings will consume around £30 less electricity a year than conventional machines. This means a TASKI AERO will pay for itself in less than three years – representing the most competitive total cost of ownership package available.
